

No need to turn the other cheek with the latest facial contouring techniques offered

by Ms Angelica Kavouni MD FRCS EBOPRAS

‘It is always better to be looked over than overlooked’ *Mae West*

● Silhouette Cheek Lift:

Reclaim your cheeks with patented sutures that will give your cheeks a lift that even Kate Moss would envy.

● How does it work?

The suture is passed under the skin and invisibly anchored in the hair line. Soft tissue naturally grows around the suture giving a long lasting result, creating natural contours, lifting cheeks and tightening of loose neck skin

● Why choose the Silhouette lift?

- Safe and effective with no adverse reactions
- Minimally invasive with only two tiny incisions hidden in the hairline
- Compliments blepharoplasty (eyelid lift); endoscopic brow lifts; buccal fat removal and neck lifts
- Short recovery time
- Great for the younger person seeking cheek definition
- Cheaper than a facelift
- Effect can last for up to 5 years
- Has passed stringent safety tests in the USA and Europe

● Endotine Ribbon™ jawline lift:

Restore jawline definition and stop that sagging neck in its tracks with the latest minimally invasive technique – the Endotine Ribbon™.

● How does it work?

This patented ‘ribbon’ is placed invisibly under the skin in the desired area under local anaesthetic and much the same as the Silhouette Lift, allows soft tissue growth which anchors the device before it dissolves and is reabsorbed.

● Why choose the Endotine Ribbon™ system?

- Safe and effective with no adverse reactions
- These ‘ribbons’ do not need removing
- Effect, can last up to 5 years
- Performed under local anaesthetic in the office or day surgery
- Offers improved control over the jaw and neck shape
- Minimises scarring
